

Metalier Australia - Liquid Metals Nano Clear Coat

A cutting edge formulation

The difference with Metalier's Clear Coat is that it is designed to be applied with a fine layer of material. It is misted onto the decorative metal finish so that sufficient coverage is achieved. The metal is protected but the plastic look is avoided. And it's so strong. If not abraided it will last 5-10 years, perhaps longer.

One of the reasons that the Nano Metal Clear Coat is different from other coatings is that it combines organic polymers with inorganic oxides in a different ratio and combines them at a molecular level using nano technology. Which means that it works at a molecular level. And as an added bonus the coating gives UV protection and is an anti-graffiti coating as well.

The slip co-efficient is in the 30s so it is not slippery to walk on if it is used as a coating to protect flooring. Yes – it is so strong that you can walk on it.

Metalier's Nano Metal Clear Coat is an option when you want to preserve the look created and do not want oxidisation to continue.
